

QI Resolved

for

Quinquennial Inspection Reports

App Proposal

CONFIDENTIAL

Brief Introduction

Quinquennial Inspections for ecclesiastical buildings are very often among the first documents one would look into when considering maintenance works, access improvements, major reordering & redevelopments, or in some cases, disposal of properties and parish restructuring.

In many architectural practices it could be time-consuming to sort long lists of defects according to their location and urgency for suggested repairs, even with the help of a mix of existing software like Word, Excel or Pages. Many practices choose not to include pictures for every defect due to time and staff costs.

To many churches, it could be overwhelming to receive a very long list of defects without knowing exactly where the defects are, or how to locate the defect on particular architectural elements (*e.g. inner side of parapets, tower louvres, corbels, hood moulds, quoin and kneeler stones...*). In many cases, defects are overlooked, only to be found deteriorated in the next quinquennium, which could require costly repairs.

QI Resolved is an app for Quinquennial Inspectors that aids inspection on site, sort lists of defects and produce a report to clients. It addresses existing issues with workflow, improves efficiency and communication to clients. This report explores the issues in the current workflow and suggests how the propose app would resolve them.

Brief Introduction	2
Typical Format for a Quinquennial Inspection Report	4
Feature 1 - Defect Data Hierarchy	5
Feature 2 - Photo-to-Defect Reference	6
Feature 3 - Floor Plan Pinning	7
Feature 4 - Grouping Defects and Costs, and Cross-Referencing	8
Feature 5 - Historic Comparison	9
Feature 6 - Table of Contents & Document Structure	10
Feature 7 - PDF / Report Generation	11
Feature 8 - Appendices / Supporting Docs	12
Feature 9 - Templates for Different Denominations	13
Potential Workflow : During the Inspection	14
Potential Workflow : After the Inspection	15

Typical Format for a Quinquennial Inspection Report

- Front Page
- Table of Content
- Church Details, Inspection Details
- Site and Floor Plans
- Scope of the Report, Limitations, Regulation Notes, Repairs Priority
- Legend
- Schedule of Works in the Past Quinquennium
- Executive Condition Summary
- Report
 - External Conditions
 - Rainwater Goods
 - Internal Conditions
 - Service Installations
 - Fire Precautions
 - Access
 - Insurance
 - H&S
 - Asbestos
 - Curtilage
- Recommendations
- Appendices

Feature 1 - Defect Data Hierarchy

Issue:

Many reports organise defects by a location hierarchy

(Site > Building > Floor > Room > Element > Defect)

with a unique code to each floor, room and element, but the hierarchy differs by building type (*e.g. a non-conformist chapel could have a Sanctuary, an attached Hall, and a five-storey extension, compared to a 500-year-old standalone parish church*). Manually adjusting the Word template at project set-up is time-consuming.

Solution:

Don't hardcode a hierarchy and let the app reference the defects by room.

The inspector can sort the room hierarchy at the end of the inspection.

Feature 2 - Photo-to-Defect Reference

Issue:

Many defects are cross-referenced (*e.g. missing tiles on the roof are linked to the water ingress in the room below*). This is manually assigned and error-prone.

Solution:

During the inspection, when a photo is taken on the app, a Defect ID is tied to that photo, its pinned location on the floor plan, and its caption.

Feature 3 - Floor Plan Pinning

Issue:

Clients want to know where the defects are located, especially those that cannot be easily seen at Ground level.

e.g. For a church with multiple decorated turrets: (defect - 5mm crack to the third corbel from the right at clerestory level, on the South-West side of the turret, fourth from the East end.)

Solution:

Let the inspector upload a floor plan / site plan per level, then drop a pin per defect. Pins should be tappable to reveal photo + description + urgency + estimated cost range.

Feature 4 - Grouping Defects and Costs, and Cross-Referencing

Issue:

Several defects share one repair cost (*e.g. repointing for all elevations / unblocking gullies and gutters*). Inputting the data manually is error-prone.

Solution:

Support a 'linked defects' or 'grouped estimate' feature, which allow multiple defect records to point to a single cost line item, so the report does not double-count.

Feature 5 - Historic Comparison

Issue:

For denominations where keeping a log book is not common practice, outstanding items from the previous quinquennium are easily overlooked.

Solution:

Let each church have a persistent defect history across past quinquennial cycles, so a new inspection can auto-populate previous recommendations and prompt the inspector to mark each as **Resolved / Ongoing / Worsened**, rather than retyping from scratch.

Feature 6 - Table of Contents & Document Structure

Issue:

Inconsistent template for standard matters (Caveats, Regulations Notes, Inspecting Architect Bio, Revision History, Scope of Report) which are largely reusable text with a few church-specific variables swapped in.

Solution:

Template system: company-level boilerplate sections (Caveats, Regulations Notes, Standard Priority-code Legend) that auto-populate, plus a project-level variable set (church name, address, listing grade, diocese, date of inspection, weather).

Auto-generate Table of Contents from section headers with live page numbers once the PDF is compiled.

Feature 7 - PDF / Report Generation

What the app supports:

Fairly standard templated PDF export, with Word / InDesign-style template from the database.

Could investigate in a client-friendly app in the long-term to provide an easier way to keep track on maintenance and deterioration of the building fabric.

Feature 8 - Appendices / Supporting Docs

What the app supports:

A standardised check-list for up-to-date external reports (PAT Testing, Lightning Test, Risk Assessments), and keep track on historical reports (Asbestos Report, Survey of the Burial Ground).

Feature 9 - Templates for Different Denominations

Issue:

Different denominations have different standards (*e.g. External Doors as a standalone inspected item, including the Curtilage as part of the Quinquennial Inspection*).

Solution:

A bespoke checklist / template for each denomination. With data input from inspectors.

Potential Workflow : During the Inspection

Potential Workflow : After the Inspection

Re-shuffle the
Rooms

On the Recommendations Panel,
Group similar Defects into the same
Item, and Assign a Cost

e.g.

Defect	Defect ID	Cost Range
Redecoration to timber fascias, doors.	3.4.5, 3.6.5, 3.9.5	A

Defect Number

Room Number

*“Go up to the mountain, bring timber, and build the house:
and it shall be acceptable to me, and I shall be glorified, saith the Lord.”*
